

Hybrid Mobile Connectivity for Enterprises

NEXT-GENERATION MOBILE CONNECTED ASSETS NEED TO OPERATE ANYWHERE, ANYTIME, WITH EXCEPTIONAL RELIABILITY

It's Time for Smarter Connectivity Solutions

As the volume of connected assets surges, enterprises need much more from their connectivity. It must enable a wide variety of assets including robotics, autonomous vehicles, connected workers and sensors. As devices become increasingly mobile, connectivity must also support seamless automation for on-site, multi-site and off-site operations. And for enterprises with post-sale digital subscription services, visibility and control is needed for customer devices that connect to the public network.

The Connectivity Challenge

Meeting the growing connectivity demands for modernization requires more than what traditional solutions offer—they simply can't deliver the necessary bandwidth and coverage needed for.

- » **Private network limitations:** Traditional fixed, Wi-Fi and stand-alone private mobile networks don't cost-effectively deliver and support the widening coverage areas and low latency that modern connected devices need.
- » **Public network limitations:** Existing public network connectivity offerings provide coverage but fail to deliver the visibility and control needed for wide-area business processes.
- » **Network separation:** Separate private and public connectivity offerings with different SIM's and APNs complicates downstream processing issues.

With Expeto, enterprises have the seamless LTE/5G connectivity needed for business-critical next generation connected assets that depend on secure, always available connectivity.

EXPETO OVERVIEW

Hybrid Connectivity is the Answer

The solution is LTE/5G which is designed to support the connectivity needed by the millions of devices being deployed for business automation. The challenge now for enterprises is to find the right solution - a hybrid mobile network that provides the scalability, reliability, and security of private networks with the coverage of the public network.

Private Network Control with Public Network Coverage

Expeto's software platform simplifies the complex connectivity requirements that enterprises need for their business-critical operations in multi-site private and public locations.

Expeto's software platform provides a private network coupled with an overlay for public networks, using a single SIM to deliver the seamless connectivity, asset visibility and control needed for business operations. It uses API integration into existing enterprise operational and IT systems to centralize the management of policies and security needed by business applications.

The Expeto Advantage for Enterprises

- » **Extend private networking anywhere:** Seamless connectivity across private and public LTE/5G networks to support connected assets that depend on always-available connectivity.
- » **Continuous device connection with a single SIM:** Seamless continuity of service for assets traversing private and public networks, with IP address management and utilizing a single SIM for highly mobile devices such as connected vehicles and workers.
- » **Full device visibility and control:** Real-time, direct control of each connected device with centralized operations for policy and security enforcement, without mobile operator involvement.
- » **Cost and data management:** Data path control for privacy and sovereignty compliance; along with the ability to optimize network usage across speed, QoS, coverage and cost.
- » **Streamlined management:** Standardized API integration into network management systems, with multi-site control from a single pane of glass.

Expeto delivers the connectivity that enterprises need:

Multi-site LTE/5G connectivity for private distributed operations

Private-over-public LTE/5G connectivity for wide area operations

Seamless hybrid private/public LTE/5G connectivity to support highly mobile devices.

Expeto is the leading supplier of software solutions built to deliver seamless connectivity across public and private mobile networks. The Expeto platform unifies control and visibility of next generation connected assets as they traverse networks. With Expeto's patented solution, enterprises seamlessly integrate their IT/OT systems to centrally manage all connected devices and enforce policies from a single control center. Headquartered in Canada, Expeto equips mobile network operators, enterprise and government customers with unprecedented networking flexibility to fully utilize connected assets to modernize and secure their operations across global and multi-site locations. Expeto supports any connected device, including vehicles, industrial equipment, and workforce devices.
